                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised cantibody, Herceptin, at an affinity of at least 10.8. The present CC invention is based upon the initial discovery of an alternative HER-2 CC mRNA transcript with 274 bp insert of intron 8. The translation product CC of the alternative transcript is a truncated HER-2 protein designated CC p68HER-2 which lacks the transmembrane and intracellular domains of CC p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. CT The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise CC the HER-2 receptor. The peptides which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify CC solid tumours. The present sequence is human p68HER-2 generic protein CC containing ECDIIIa variant sequence.

CC Note: The present sequence is not shown in the specification but is certain particularly (AAE09181).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                    Query Match
                                                                                               Matches
                                                                                                                                                                The present invention relates to a method for treating a solid tumour characterised by endothelial growth factor receptor (EGFR) expression. The method involves administering an agent that binds to an extracellular domain (ECD) of EGFR. The invention also relates to a naturally occurring inhibitor of HER-2 receptor tyrosine kinase called herstatin. The coexpression of herstatin with p185HER2 causes a striking reduction in cell growth that corresponds with suppression of p185 autophosphorylation. The method or a pharmaceutical composition is useful for treating a solid tumour (selected from squamous cell carcinoma, lung carcinoma, colon carcinoma and g1ial cell tumour) characterised by EGFR expression. The present sequence is human truncated HER2 protein that lacks transmembrane and intracellular domains.
                                                                                                                                                                                                                                                                                                                                                        Treating solid tumor characterized by expression of endothelial factor receptor, involves administering recombinant herstatin to binds to extracellular domain of the endothelial growth factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               14-AUG-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Misc-difference

                                                                                            polypeptide, which binds to the treatment of hard tumors -
                                                                                                extracellular domain
                                                                                                of HER-2 for
```

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated possible. The transcript is a truncated HER-2 protein designated possible. The contains ECD I I of the pl85HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify anticid time. solid tumours. The present sequence is human p68HER-2 containing ECDIIIa variant sequence.
Note: The present sequence is not shown in the specifi derived from p68HER-2 generic sequence (SEQ ID NO:2) s sequence from p68HER-2 generic sequence listing (AAE09181). specification NO:2) shown in generic n but is protein

QΥ
                                                                                                                                                        The invention relates to novel HER-2 (herstatin-2) antagonist

particularly a polypeptide that binds to the extracellular domain (ECD)

of HER-2 at a site that is different from the binding site of humanised

antibody, Herceptin, at an affinity of at least 10^8. The present

invention is based upon the initial discovery of an alternative HER-2

mRNA transcript with 274 bp insert of intron 8. The translation product

of the alternative transcript is a truncated HER-2 protein designated

p88HER-2 which lacks the transmembrane and intracellular domains of

p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa.

The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise

the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the

nucleic acids encoding these are useful to treat, diagnose and identify

solid tumours. The present sequence is human p68HER-2 generic protein

containing ECDIIIa variant sequence.

The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmbrane and intracellular domains of p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing ECDIII variant sequence.

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 bit contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify
             solid tumours. The present sequence is human p68HER-2 containing ECDIIIa variant sequence. Note: The present sequence is not shown in the specifiderived from p68HER-2 generic sequence (SEQ ID NO:2) s
                                                                                                                                                                                                                                                                                                                                        Example 11; Page -; 61pp; English

                                                                                                                  밁
                                                                                                                                              Q
                                                                                                                                                                           맑
                                                                                                                                                                                                     Q
                                                                                                                                                                                                                                                               Ş
                                                                                                                                                                                                                                                                                                                                                                             The invention relates to novel HER-2 (herstatin-2) antagonist CC particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised cantibody, Herceptin, at an affinity of at least 10°8. The present convention is based upon the initial discovery of an alternative HER-2 coments at truncated HER-2 protein designated to fithe alternative transcript is a truncated HER-2 protein designated coments. The present sequence and intracellular domains of p185HER-2 which lacks the transmembrane and intracellular domains of cp185HER-2 which lacks the transmembrane and intracellular domains of cp185HER-2 but contains ECD I I I of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise concluded a containing these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing ECDIIIa variant sequence.

Note: The present sequence is not shown in the specification but is containing ECDIIIa variant sequence (SEQ ID NO:2) shown in the sequence listing (AAE09181).
                                                                                                                                                                                                                                                                                              Query Match

```
particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10'8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product
                                                                                                                                                                                                                                                                                                                                                                                                                    HER-2;

```
of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               solid tumours. The present sequence is human containing ECDIIIa variant sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: The present sequence is not shown derived from p68HER-2 generic sequence sequence listing (AAE09181).

                                                                                                  particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8: The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 protein
                                                                                  Sequence
                                                                                                                                                                                                                                       The invention relates to novel HER-2 (herstatin-2) antagonist
                                                                                                                                                                                                                                                            Claim

                                                                                                                                                                                                                                                                                                                                                                          RESULT 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to novel HER-2 (herstatin-2) antagonist CC particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody. Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing ECDIIIa variant sequence.

Note: The present sequence is not shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                 particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present CC invention is based upon the initial discovery of an alternative HER-2 CC mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated CC p68HER-2 which lacks the transmembrane and intracellular domains of CC p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify containing ECDIIIa variant sequence. Solid tumours. The present sequence is human p68HER-2 generic protein CC containing ECDIIIa variant sequence (SEQ ID NO:2) shown in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Misc-difference

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody. Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of p189HER-2 but contains ECD i, ii of the p189HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              solid tumours. The present sequence is human p68HER-2 containing ECDIIIa variant sequence. Note: The present sequence is not shown in the specifiderived from p68HER-2 generic sequence (SEQ ID NO:13) sequence listing (AAE09183).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10%. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated of the alternative transcript is a truncated HER-2 protein designated
                            p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify
        solid tumours. The present sequence is human containing ECDIIIa variant sequence.
                                                                                                                                                                                                                WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Key

                                                                                                                                                                Ş
                                                                                                                                                                                                     Ъ
                                                                                                                                                                                                                                   δõ
                                                                                                                                                                                                                                                                                                                                            The invention relates to novel HER-2 (herstatin-2) antagonist CC particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised CC antibody, Herceptin, at an affinity of at least 10°8. The present CC invention is based upon the initial discovery of an alternative HER-2 CC mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated CC p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein Containing ECDIIIa variant sequence.

Note: The present sequence is human p68HER-2 generic protein the sequence listing (AAE09183).
